PROFILE

Senior Frontend Developer with full stack experience and an Information Systems Engineering degree. 10+ years building production software, today with React, Node and TypeScript, previously Laravel. I focus on migrating legacy systems, building software the business can configure without deploys, and applying mathematical optimization to operational processes.

Portfolio with case studies and live demos: **portfolio-patricio-polito.netlify.app/en/**

EXPERIENCE

Senior Frontend Developer · Quadion Tech · Buenos Aires · Remote — Dec 2023 – present

- Part of the team migrating the member portal of a leading national health insurer from microfrontends (Module Federation) to a modular monolith.
- Building shared-library components in Storybook from Figma designs: steppers, breadcrumbs, file upload with signed URLs and analytics.
- Working on the contingency system with Firebase Remote Config that turns off a request or puts the portal in maintenance with no deploys.
- Built the benefits platform with Next.js, with a mobile-first Google Maps view: clustering, businesses sharing a location and QR redemption.
- Writing unit (Jest, later Vitest) and end-to-end (Playwright) tests, run in GitLab pipelines with security scanning that deploy to Kubernetes.

`React · TypeScript · Next.js · Module Federation · Storybook · Material UI · Vitest · Playwright · GitLab CI`

Senior Developer · Sertic · Rosario · Remote — Apr 2021 – Jun 2026

Since December 2023, occasional maintenance of legacy projects.

- Built a quality monitoring platform for an international call center: dynamic forms and a migration from Laravel to React + Node.
- Optimized stored procedures so reports over large data volumes load fast.
- Built and evolved internal systems, refactoring with design patterns and adding automated tests.

`Laravel · React · Node.js · Angular · jQuery · SQL Server · REST API`

Mid-level Developer · Tensolite S.A. / Sitenso — 2020 – Apr 2021

- Part of the team behind a turnover-based storage system, from the analysis stage; I built the production planning, per-quadrant stock and loading plan. Truck waits dropped from up to 3 days to zero for on-time arrivals.
- Optimized steel usage in joist production with integer linear programming.
- Maintained corporate systems and integrated SOAP services.

`PHP · Laravel · React · jQuery · REST API · SOAP`

Freelance developer · Schools — 2018 – 2019

- Migrated a school's desktop system to the web.
- Built an online payments module with QR codes.
- Built a web and mobile app for real-time notifications and messaging with Firebase.

`Laravel · Firebird · React · Firebase · jQuery`

Freelance developer · EdTech startup — 2018

- Built the front end of an educational reading app.

`React · React Native`

Developer · Ministry of Productive Development of Tucumán — 2016 – May 2018

- Built a contract management system and other internal systems.
- Built the institutional WordPress website; also provided IT support and network maintenance.

`Laravel · jQuery · WordPress`

Technical support · Teleperformance — 2010 – 2014

- Provided technical support to internet, VoIP and digital TV customers.

SELECTED CASE STUDIES

One platform, dozens of member requests, a single experience — A consistent experience across every request and a platform that degrades gracefully; when something fails, one request goes down, not the portal, and with no deploys.

Benefits on the map, from phone to coupon — A map that handles density and shared locations well, and a complete journey from search to coupon designed for the phone.

Forms you configure, not code — Creating or changing a form became configuration, with no deploys. Fast reports over large volumes and a stack aligned with the rest of the company.

Turnover-based storage at a precast concrete plant — Waiting time dropped to zero for trucks arriving during their slot, and loading time inside the plant went down considerably.

Less steel with integer linear programming — Planning stopped relying on intuition. Each joist is made with the steel its length requires, and steel consumption went down.

STACK

Frontend	React, TypeScript, Next.js, JavaScript (ES6+), Microfrontends (Module Federation), Storybook, Material UI, React Native, Angular, Bootstrap, jQuery
Backend	Node.js, Express, PHP, Laravel, REST API, SOAP
Data	SQL Server (stored procedures), MySQL, PostgreSQL, Firebird
Quality	Jest, Vitest, Playwright, Cypress, PHPUnit
Tooling	Git, GitLab CI, Docker, Kubernetes, Firebase Remote Config, Figma, Webpack, SCRUM
Exploring	n8n, Claude API, LangChain, LangGraph

EDUCATION

Information Systems Engineering · `Bachelor's-level engineering degree` · `2025`
National Technological University (UTN) — Tucumán Regional Faculty

Computer Technician · `2000 – 2006`
Technical School No. 5, Tucumán

LANGUAGES

Spanish (native) · English (pre-intermediate)
